2. AI Tool Overview

- The AI tool used is Imagine Art AI, a text-to-image generator widely used for creating high-quality visual content. I chose this tool because it is highly effective in producing architectural visualizations based on descriptive prompts. As an architecture student, visualization is important in communicating design ideas, and Imagine Art AI allows users to quickly generate realistic perspectives without requiring advanced rendering software.

3. Original Prompt

- “create a modern 2 storey tropical house exterior located in the Philippines. Use natural materials and add tropical landscaping.”
- Generated Output:

4. AI-assisted prompt

- LLM used: ChatGPT
- Improved Prompt:

Ultra-realistic exterior render of a 2-storey modern tropical house located in a warm, humid Southeast Asian climate. The design features clean horizontal lines, wide overhangs, flat or low-pitched roofs, and a combination of natural materials such as wood, stone, and textured concrete. Incorporate large floor-to-ceiling glass windows and sliding doors to maximize indoor-outdoor connection.

Include tropical landscaping with palm trees, lush greenery, ornamental grasses, and a small garden or courtyard. Add a shaded terrace or balcony with wooden louvers or sun screens for passive cooling. The house should have an open and airy feel with cross-ventilation design elements.

Set during golden hour with warm natural lighting, soft shadows, and realistic reflections. Use a slightly angled perspective (eye-level or 3/4 view) showing both floors clearly. Include subtle environmental details such as a driveway, pathway lighting, and outdoor furniture. Render in high resolution with photorealistic textures, global illumination, and cinematic quality.

- Generated Output:

5. Comparison and Analysis

- After comparing the two generated images, I can clearly observe a significant improvement in the second output, which was produced using the AI-assisted prompt. The first image, created from my original prompt, already presents a modern tropical house, but it looks more generic and limited in detail. The composition is mostly front-facing and symmetrical, focusing on a clean facade but lacking depth and environmental interaction. While it includes some tropical elements like palm trees and wooden finishes, these are not strongly emphasized, making the design feel somewhat flat and less contextualized.

In contrast, the second image is more refined, dynamic, and visually engaging. The angled perspective allows a better understanding of the building's form and spatial relationships. There is also a clearer application of modern tropical architectural principles, such as wide overhangs, material variety (wood, stone, and concrete), and the use of shading devices like wooden screens. These elements not only enhance the aesthetics but also reflect functional design strategies suited for a tropical climate. Additionally, the landscaping in the second image is more developed, with varied vegetation, pathways, and outdoor elements that make the environment feel more realistic and integrated with the structure. Lighting also plays a major role in the improvement. The second output uses warm golden hour lighting, producing softer shadows, realistic reflections, and a more cinematic quality. Compared to the first image, which appears slightly flat, the second has more depth, atmosphere, and a stronger sense of realism.

Through this activity, I realized how important prompt writing is in influencing AI-generated results. Initially, I thought a simple prompt would be sufficient, but the comparison showed that detailed and structured prompts lead to more accurate and high-quality outputs. The improved prompt acted like a design brief, guiding the AI to include specific architectural features, environmental context, and lighting conditions. This made the result more aligned with real-world design principles. Overall, this experience helped me understand that making prompts is not just a technical skill but also a creative process, similar to how architects communicate ideas through clear and detailed design concepts.
